## 1 Download and Installation

### 1.1 Download from MATLAB File Exchange

The tridiagonal function is available for download on MATLAB File Exchange at https://www.mathworks.com/matlabcentral/fileexchange/85438-tridiagonal-matrix-algorithm-thomas-alg-tridiagonal.

#### 1.2 Download from GitHub

The tridiagonal function is available for download on GitHub at https://github.com/tamaskis/tridiagonal-MATLAB.

#### 1.3 Files Included With Download

There are **five** files included in the downloaded zip file:

- 1. EXAMPLE.M example for using the tridiagonal function
- 2. LICENSE *license for the* tridiagonal *function*
- 3. README.md markdown file for GitHub documentation
- 4. Tridiagonal Matrix Algorithm MATLAB Implementation.pdf this PDF
- 5. tridiagonal.m-MATLAB function implementing the tridiagonal matrix algorithm

## 1.4 Accessing the tridiagonal Function in a MATLAB Script

There are **four** options for accessing the tridiagonal function in a MATLAB script:

- 1. Copy the tridiagonal function to the *end* of your MATLAB script.
- 2. Place the tridiagonal.m file in the same folder as the MATLAB script.
- 3. Place the tridiagonal.m file into whatever folder you want, and then use the addpath(folderName) command where the folderName parameter is a string that stores the filepath of the folder that tridiagonal.m is in *relative to* the folder that your script is in.
- 4. Make a toolbox by first opening tridiagonal.m, then going to the HOME tab in MATLAB, and finally selecting Package Toolbox in the drop-down menu under Add-Ons. Once you package the tridiagonal function as a toolbox, you can use it in any script.

https://www.mathworks.com/help/matlab/ref/addpath.html

## 2 tridiagonal

#### **Syntax**

```
x = tridiagonal(A,d)
```

#### **Description**

 $\mathbf{x} = \mathtt{tridiagonal}(A,d)$  solves the tridiagonal linear system  $A\mathbf{x} = \mathbf{d}$  for the vector  $\mathbf{s}\mathbf{x} \in \mathbb{R}^n$ , where  $A \in \mathbb{R}^{n \times n}$  is a tridiagonal matrix and  $\mathbf{d} \in \mathbb{R}^n$  is a vector.

#### **Example**

Example 2.1

Solve the tridiagonal linear system  $A\mathbf{x} = \mathbf{d}$  for  $\mathbf{x}$ , where

$$A = \begin{bmatrix} 1 & 2 & 0 & 0 & 0 \\ 3 & 4 & 5 & 0 & 0 \\ 0 & 6 & 7 & 8 & 0 \\ 0 & 0 & 9 & 1 & 2 \\ 0 & 0 & 0 & 3 & 4 \end{bmatrix}, \quad \mathbf{d} = \begin{bmatrix} 1 \\ 2 \\ 3 \\ 4 \\ 5 \end{bmatrix}$$

#### **■** SOLUTION

Entering A and d into MATLAB,

To solve the tridiagonal linear system for x,

$$x = tridiagonal(A,d)$$

This yields the result

## 3 Tridiagonal Matrix Algorithm (Thomas Algorithm)

A tridiagonal linear system is one of the form

$$\begin{bmatrix} b_1 & c_1 \\ a_1 & b_2 & c_2 \\ & a_2 & \ddots & \ddots \\ & & \ddots & \ddots & c_{n-2} \\ & & & a_{n-2} & b_{n-1} & c_{n-1} \\ & & & & a_{n-1} & b_n \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_{n-1} \\ x_n \end{bmatrix} = \begin{bmatrix} d_1 \\ d_2 \\ \vdots \\ d_{n-1} \\ d_n \end{bmatrix}$$

We can define the x and d vectors as

$$\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_{n-1} \\ x_n \end{bmatrix}, \quad \mathbf{d} = \begin{bmatrix} d_1 \\ d_2 \\ \vdots \\ d_{n-1} \\ d_n \end{bmatrix}$$

and the  $n \times n$  triadiagonal matrix<sup>2</sup>, A, as

$$A = \begin{bmatrix} b_1 & c_1 \\ a_1 & b_2 & c_2 \\ & a_2 & \ddots & \ddots \\ & & \ddots & \ddots & c_{n-2} \\ & & & a_{n-2} & b_{n-1} & c_{n-1} \\ & & & & a_{n-1} & b_n \end{bmatrix}$$
 (1)

Now we can write the tridiagonal linear system as

$$A\mathbf{x} = \mathbf{d} \tag{2}$$

where  $A \in \mathbb{R}^{n \times n}$  and  $\mathbf{x}, \mathbf{d} \in \mathbb{R}^n$ .

The **tridiagonal matrix algorithm** (also known as the **Thomas algorithm**) is an algorithm that can efficiently solve the tridiagonal linear system (given by Eq. (2)) for x. This algorithm uses three vectors, a, b, and c, which we

However, when dealing with the tridiagonal matrix algorithm, a convention similar to the one in Eq. (1) is used almost exclusively. However, the convention that most sources have has the  $a_i$ 's ranging from  $a_2$  to  $a_n$ , which is extremely inconvenient from an algorithmic standpoint; therefore, I defined them here as ranging from  $a_1$  to  $a_{n-1}$ , and this is also reflected in Algorithm 1.

<sup>&</sup>lt;sup>2</sup> In many references, a tridiagonal matrix is defined with the convention

define as [1]

$$\mathbf{a} = \begin{bmatrix} a_1 \\ \vdots \\ a_{n-1} \end{bmatrix}, \quad \mathbf{b} = \begin{bmatrix} b_1 \\ \vdots \\ b_n \end{bmatrix}, \quad \mathbf{c} = \begin{bmatrix} c_1 \\ \vdots \\ c_{n-1} \end{bmatrix}$$

The tridiagonal matrix algorithm is shown below [1-3].

#### Algorithm 1: Tridiagonal matrix algorithm (Thomas algorithm).

```
1 Given: A, x, d
  // determines n (where A \in \mathbb{R}^{n \times n})
n = size(A, 1)
3 Preallocate vectors of size n \times 1 to store b and x.
4 Preallocate vectors of size (n-1) \times 1 to store a and c.
  // extracts a from A
5 for i=2 to n do
6 a_{i-1} = A_{i,i-1}
7 end
  // extracts b from A
s for i=1 to n do
b_i = A_{i,i}
10 end
  // extracts c from A
11 for i=2 to n do
12 c_{i-1} = A_{i-1,i}
13 end
  // forward elimination
14 for i=1 to n do
      w = a_{i-1}/b_{i-1}
15
      b_i = b_i - wc_{i-1}
    d_i = d_i - wd_{i-1}
18 end
```

// backward substitution

19 
$$x_n = d_n/b_n$$
  
20 for  $i = n-1$  to  $1$  by  $-1$  do

21 
$$x_i = (d_i - c_i x_{i+1})/b_i$$

22 end

23 return x
