# Tridiagonal Matrix Algorithm

*MATLAB Implementation*

Tamas Kis | kis@stanford.edu

# Contents

# `tridiagonal`

## Syntax

```
x = tridiagonal(A,d)
```

## Description

`x = tridiagonal(A,d)` solves the tridiagonal linear system $A\mathbf{x} = \mathbf{d}$ for the vector $\mathbf{x} \in \mathbb{R}^n$, where $A \in \mathbb{R}^{n \times n}$ is a tridiagonal matrix and $\mathbf{d} \in \mathbb{R}^n$ is a vector.

## Examples

**Example 1**

Solve the tridiagonal linear system $A\mathbf{x} = \mathbf{d}$ for $\mathbf{x}$, where

$$A = \begin{bmatrix} 1 & 2 & 0 & 0 & 0 \\ 3 & 4 & 5 & 0 & 0 \\ 0 & 6 & 7 & 8 & 0 \\ 0 & 0 & 9 & 1 & 2 \\ 0 & 0 & 0 & 3 & 4 \end{bmatrix}, \quad \mathbf{d} = \begin{bmatrix} 1 \\ 2 \\ 3 \\ 4 \\ 5 \end{bmatrix}$$

■ *SOLUTION*

Entering $A$ and $\mathbf{d}$ into MATLAB,

```
% defines tridiagonal matrix A
A = [1,2,0,0,0;
     3,4,5,0,0;
     0,6,7,8,0;
     0,0,9,1,2;
     0,0,0,3,4];

% defines vector d
d = [1;
     2;
     3;
     4;
     5];
```

To solve the tridiagonal linear system for $\mathbf{x}$,

```
x = tridiagonal(A,d)
```

This yields the result

```
x =
```

```
   -0.7229
    0.8614
    0.1446
   -0.3976
    1.5482
```

# Tridiagonal Matrix Algorithm (Thomas Algorithm)

A tridiagonal linear system is one of the form

$$\begin{bmatrix} b_1 & c_1 \\ a_1 & b_2 & c_2 \\ & a_2 & \ddots & \ddots \\ & & \ddots & \ddots & c_{n-2} \\ & & & a_{n-2} & b_{n-1} & c_{n-1} \\ & & & & a_{n-1} & b_n \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_{n-1} \\ x_n \end{bmatrix} = \begin{bmatrix} d_1 \\ d_2 \\ \vdots \\ d_{n-1} \\ d_n \end{bmatrix}$$

We can define the $\mathbf{x}$ and $\mathbf{d}$ vectors as

$$\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_{n-1} \\ x_n \end{bmatrix}, \quad \mathbf{d} = \begin{bmatrix} d_1 \\ d_2 \\ \vdots \\ d_{n-1} \\ d_n \end{bmatrix}$$

and the $n \times n$ **triadiagonal matrix**[1], $A$, as

$$A = \begin{bmatrix} b_1 & c_1 \\ a_1 & b_2 & c_2 \\ & a_2 & \ddots & \ddots \\ & & \ddots & \ddots & c_{n-2} \\ & & & a_{n-2} & b_{n-1} & c_{n-1} \\ & & & & a_{n-1} & b_n \end{bmatrix} \tag{1}$$

Now we can write the tridiagonal linear system as

$$A\mathbf{x} = \mathbf{d} \tag{2}$$

where $A \in \mathbb{R}^{n \times n}$ and $\mathbf{x}, \mathbf{d} \in \mathbb{R}^n$.

The **tridiagonal matrix algorithm** (also known as the **Thomas algorithm**) is an algorithm that can efficiently solve the tridiagonal linear system (given by Eq. (2)) for $\mathbf{x}$. This algorithm uses three vectors, $\mathbf{a}$, $\mathbf{b}$, and $\mathbf{c}$, which we

---

[1] In many references, a tridiagonal matrix is defined with the convention

$$A = \begin{bmatrix} a_1 & b_1 \\ c_1 & a_2 & b_2 \\ & c_2 & \ddots & \ddots \\ & & \ddots & \ddots & b_{n-2} \\ & & & c_{n-2} & a_{n-1} & b_{n-1} \\ & & & & c_{n-1} & a_n \end{bmatrix}$$

However, when dealing with the tridiagonal matrix algorithm, a convention similar to the one in Eq. (1) is used almost exclusively. However, the convention that most sources have has the $a_i$'s ranging from $a_2$ to $a_n$, which is extremely inconvenient from an algorithmic standpoint; therefore, I defined them here as ranging from $a_1$ to $a_{n-1}$, and this is also reflected in Algorithm 1.

define as [1]

$$
\mathbf{a} = \begin{bmatrix} a_1 \\ \vdots \\ a_{n-1} \end{bmatrix}, \quad \mathbf{b} = \begin{bmatrix} b_1 \\ \vdots \\ b_n \end{bmatrix}, \quad \mathbf{c} = \begin{bmatrix} c_1 \\ \vdots \\ c_{n-1} \end{bmatrix}
$$

The tridiagonal matrix algorithm is shown below [1–3].

---

**Algorithm 1:** Tridiagonal matrix algorithm (Thomas algorithm).

---

1 Given: $A$, $\mathbf{x}$, $\mathbf{d}$

   *// determines $n$ (where $A \in \mathbb{R}^{n \times n}$)*
2 $n = \mathrm{size}(A, 1)$

3 Preallocate vectors of size $n \times 1$ to store $\mathbf{b}$ and $\mathbf{x}$.
4 Preallocate vectors of size $(n-1) \times 1$ to store $\mathbf{a}$ and $\mathbf{c}$.

   *// extracts $\mathbf{a}$ from $A$*
5 **for** $i = 2$ **to** $n$ **do**
6     $a_{i-1} = A_{i,i-1}$
7 **end**

   *// extracts $\mathbf{b}$ from $A$*
8 **for** $i = 1$ **to** $n$ **do**
9     $b_i = A_{i,i}$
10 **end**

   *// extracts $\mathbf{c}$ from $A$*
11 **for** $i = 2$ **to** $n$ **do**
12     $c_{i-1} = A_{i-1,i}$
13 **end**

   *// forward elimination*
14 **for** $i = 1$ **to** $n$ **do**
15     $w = a_{i-1}/b_{i-1}$
16     $b_i = b_i - w c_{i-1}$
17     $d_i = d_i - w d_{i-1}$
18 **end**

   *// backward substitution*
19 $x_n = d_n/b_n$
20 **for** $i = n - 1$ **to** $1$ **by** $-1$ **do**
21     $x_i = (d_i - c_i x_{i+1})/b_i$
22 **end**

23 **return** $\mathbf{x}$
